

NO INJECTION NEEDED

When treating a patient with 2 ulcers in different locations, Dr. Kapish Goyal applied LolloCaine to one area and a bottled topical anesthetic to the other. The difference was notable, he said, with no local infiltration needed for the ulcer treated with LolloCaine.

CENTRIX

The Fast Track to Patient Comfort

Two experienced dentists discover that Centrix's LolloCaine, a 20% benzocaine gel topical anesthetic in convenient single-dose packaging, relieves patient discomfort quickly and effectively while improving efficiency and patient satisfaction

For some patients, just the thought of sitting in a dental chair sparks anxiety—a fear that's often triggered by the anticipation of pain during an upcoming procedure. To relieve patient anxiety and discomfort, many clinicians rely on topical anesthetics before treatment begins.

After using Centrix's LolloCaine topical anesthetic in their practices, Dr. Craig Aebli from Sanford, FL, and Dr. Kapish Goyal from Virginia Beach, VA, discovered that it works quickly and reliably to reduce patient discomfort. Both doctors appreciated the convenient, single-use LolloPacks and said patients enjoyed the pleasant taste.

Rapid Relief, Real Results

LolloCaine is a 20% benzocaine gel that provides quick, temporary relief during painful dental procedures. After using it before restorative procedures, extractions, scaling and root planing, and injections, Dr. Aebli said, "LolloCaine is very effective as a topical anesthetic, and the onset of anesthesia was quick. Remarkably, no patients could feel anesthetic needles where the topical was applied."

When Dr. Goyal used LolloCaine for frenectomies, laser ulcer treatments, scaling and root planing,

periodontal surgeries, and other procedures, he observed "consistent rapid onset," which "minimized waiting time, improved efficiency, and contributed to a smoother workflow." Touting its "reliable performance across patients with varying sensitivity levels," he said, "LolloCaine demonstrated a stronger topical anesthetic effect" than other similar products. In some cases, he said it reduced or eliminated the need for local anesthetic injections.

Improving Efficiency, One LolloPack at a Time

"The LolloPacks are very easy to use and apply, and they eliminate potential cross-contamination and produce less waste," Dr. Aebli relayed.

Calling the LolloPack packaging "a significant differentiator compared to bulk containers," Dr. Goyal said, "The individual doses are quick and easy to apply, simplify chairside use, and reduce preparation time." Pointing out another "significant benefit," he said, "The individual units allow patients to manage discomfort at home, which improves continuity of care and enhances patient satisfaction."

Patient-Pleasing Flavors

LolloCaine is available in 4 pleasant flavors—bubble gum, cherry, mint, and piña colada—and is free of all dyes. Both doctors said their patients appreciated the flavorful, dye-free formulation.

Pleased with LolloCaine's clinical performance, Drs. Goyal and Aebli are both permanently adding the topical to their inventories. Dr. Aebli concluded, "I like the convenience of LolloCaine along with its quick onset and better patient response."

"I like the convenience of LolloCaine along with its quick onset and better patient response."

— Craig Aebli, DDS, MS, FAGD
